This module will modify an original list containing any number and combination of "red", "white", and "blue" strings and rearrange it to resemble the National Dutch flag.

```
Start
  ↓
accept a list of "red", "white", and "blue" elements
This is the original list
  ↓
for every count of "red" in the original list, write down "red."
  ↓
for every count of "white" in the original list, write down "white."
  ↓
for every count of "blue" in the original list, write down "blue."
  ↓
join your "red.", "white.", and "blue." written tally together into one whole string, in that order
  ↓
create a tally list by splitting the string at the "." to create each element, ignoring the last "." at the end of the string
  ↓
delete all the elements in the original list
  ↓
look at each element in the tally list one by one starting from the left
  ↓
take the n-th element from the tally list and append it to the original list
  ↓
Have we reached the last element in the tally list?
  → End
  ↓ (no)
proceed to the next element in the tally list
  ↑ (loop back to "take the n-th element")
```
